

# Release Information

Private Edition

This page contains release information and downloadable deliverables for the different releases of Usage Engine 2 and onwards. For each release the following downloadable deliverables are available:

- **Helm Chart Version and Git Tag** - These are used to fetch the docker image for either new installation or upgrade. See the **Installation Instructions** or **Upgrade Procedure** sections in the documentation for your version.
- **Infrastructure templates for AWS** - These are templates that can be used either as a reference or modified according to your infrastructure standards. See the **Setup** page in the Installation - AWS section in the documentation for your version.
- **mzcli** - This is the file needed to use the mzcli command line interface. See the **mzcli** section in the documentation for your version. Note! From version 10.2, this file is not downloaded from this page, but from the platform instead.
- **CI/CD Example** - These is an example of how to setup a CI/CD pipeline. The purpose is to show the typical procedures needed to build and test out configuration. See the **Install the Example CI/CD Pipeline** page in the documentation for your version. Here you can also find the URL for the Solution Base image.
- **Operations REST Interface, yaml and html** - These are static instances of the operations REST OpenAPI that can be used to expose operations such as dynamic workflow configuration, workflow execution plan, external references, etc. See the **Operations REST Interface** page in the documentation for your version. **NOTE! HTML NOT APPLICABLE FROM 2.2.** See [Important Information\[hide\]2.2/\[hide\]](#) for more information.

## Release Tracks
